

EW: "Mass spectrometry in support of the environment, food, and health interaction and disease"

Characterization of non-intentionally added substances in food packaging nanofilms by analytical approaches based on HRMS

SUSFOOD

ERA-NET ON SUSTAINABLE FOOD PRODUCTION AND CONSUMPTION

ERANET SUSFOOD: Sustainable food production

Title: Improved resource efficiency throughout the post-harvest chain of fresh-cut fruits and vegetables

The Fruit and Vegetable Sector is an important segment of the European Agroindustry, with a weight of about 18% of the value of EU agricultural production

Fresh cut products:

This sector is a major user of water; about 70% of the water consumption is for cleaning and decontamination

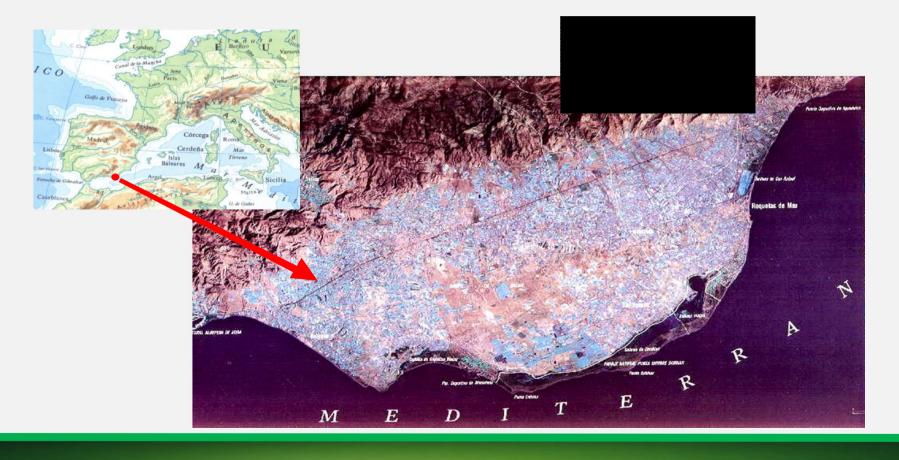

Proper disinfection technology is required to ensure microbial safety avoiding at the same time the formation of disinfection by-products such as chlorinated chemicals

Growth of microorganisms is favoured by cutting/slicing, which remove the natural barrier

The quality of fresh-cut products also depends critically on packaging technology, which has to preserve good appearance and flavour, as well as meet safety requirement

Exporters of food products. Water stressed areas, Mediterranean basin.

CEREAL

washing technologies and packaging materials

Resource-efficient food processing:

- Water savings
- Reduce use of chemicals
- Valorization of food residues

Food quality & safety:

- Extension of shelf-life
- Avoid harmful disinfection by-products
- Good appearance and flavour

Context

These goals are to be achieved by the combination of the following **nanotechnologybased solutions for fresh-cut products**:

Introduction of **new membranes with biocidal functionality** to allow operating in closed loop and the reduction or elimination of chemical disinfectants.

Development of a **hybrid technology** in which the use of **ozone** combined with **ultrafiltration** using ceramic membranes with (eventually) active surface.

Shelf-life improvement:

Development of **packaging materials with antimicrobial** components, to increase shelf life and, to reduce wastes.

Engineering and Packaging

IVV

Institute of chemistry and technology of polymers

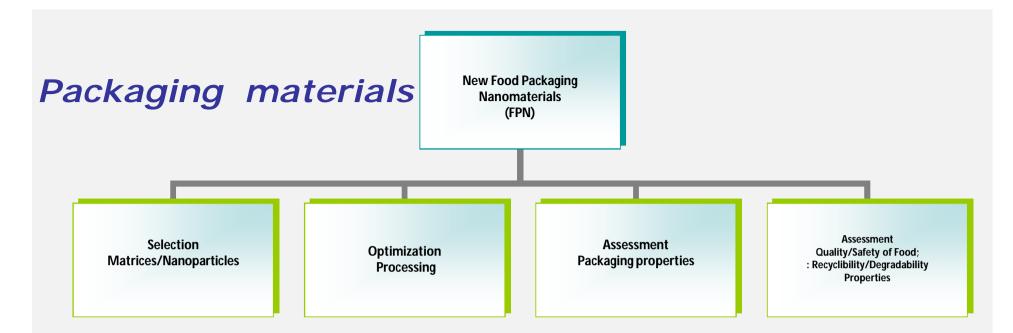

CEREAL approach

To design the new packaging materials mainly monolayers by directing the structure and properties of the polymer matrix during crystallisation taking into consideration the material characteristics, the nanoparticles shape (rod shape and plate-like), the conditions of the manufacturing packaging process (extrusion and blowing).

To develop materials having improved physical, mechanical, barrier and antibacterial activity properties that contribute to extend shelf-life and quality of the food

Development of industrial scale processes for the synthesis and the posttreatments of metal oxide nano-powders, and fabrication of nanocomposites by melt processing.

CEREAL approach for packaging materials

Consiglio Nazionale delle Ricerche

1. Development

- 2. Optimization of the processing conditions
- 3. Assessment of properties of the materials :

filler/matrix interactions, thermal stability and rheological behaviour of the nanocomposites, optical properties, UV- absorption and degradation upon illumination, thermal and mechanical properties and processability

4. Evaluation of new materials

- Migration of substances
- Antimicrobial activity, shelf life prolongation and impact on fresh-cut produce quality. Relevant test strains: Listeria monocytogenes, E. coli, Pseudomonas fluorescens, Bacillus subtilis (spores) and Aspergillus niger (spores).

Development and evaluation of packaging materials

Polypropylene –based nanocomposites

(PP)-based nanocomposites functionalized with zinc oxide nanoparticles (ZnO NPs) and polylimonene (PL)

PPR3221 (wt%)	PL (wt%)	ZnONPs (wt%)	Composition

Characterization of NIAS

a-Tocopherol acetate

Data Review - Packaging 120K 15062016 [Unknown]

PLA/PL, simulant B

PLA/PL, simulant A

> LCA Philosophy

Environmental improvements are quantified by **comparing** the damages caused by a complete system using the newly developed technologies **against** reference systems **representative** from current-use technologies

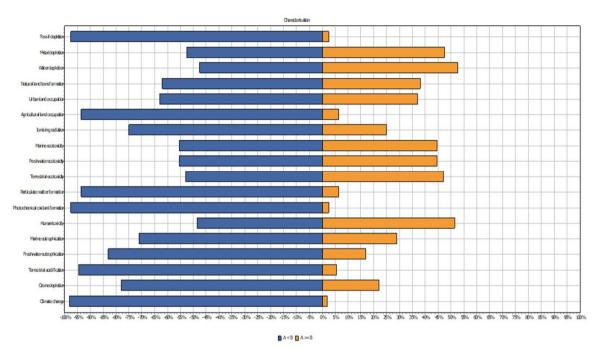

Reference scenarios: Ecoinvent database European reference Life Cycle Database ELCD (European Commission's Joint Research Centre) Data provided by the CEREAL partners

Universidad de Oviedo

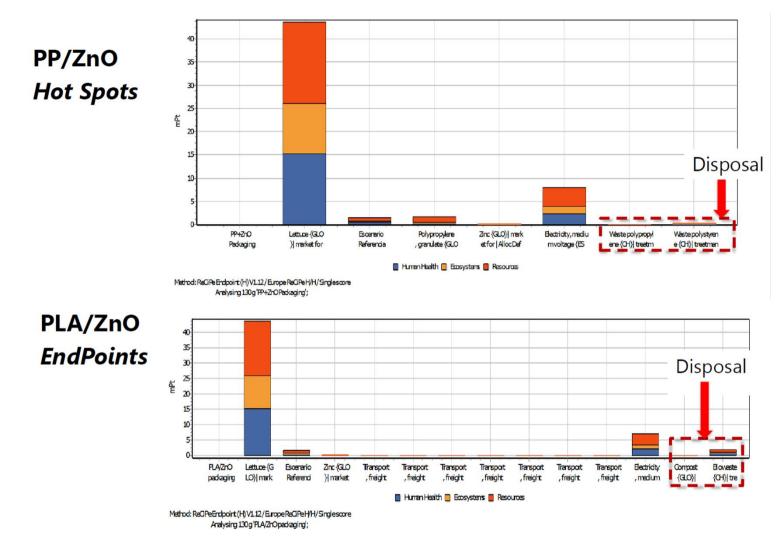

Montecarlo analysis *PLA/ZnO vs Ref*.

Midpoints show better performance in most cases for proposed package

Single score ReCiPe (H/H) shows that the use of PLA+ZnONP reduces the environmental impact of lettuce consumption by 10% while the package made from PP+ZnONP entails reductions of a 9%.

LCIA, life cycle impact assessment

The contribution of packaging to the whole environmental impact, including disposal stage, is not relevant

The production stage is by far the most environmental damaging

LCA, life cycle assessment

HRMS approach is useful for the optimization process and development of films

Migration of NIAS from PP based films in both simulants A and B, and from PLA films in simulant A and B.

NIAS detected are not included in the candidate EU list of chemicals to be evaluated for risks

Based on ZnONPs release test (ICP-MS), the nanopolymers composed of PP/ PL/ZnONPs, 92/5/3, and PLA/PL/ZnONPs provided the most suitable contact material with improved functionality

ZnONPs release test (ICP-MS): solubilization in the form of Zn^{2+} is below SML (25 mg.kg⁻¹)

PL additive appears to hinder Zn²⁺ release

mass Twin

EW: "Mass spectrometry in support of the environment, food, and health interaction and disease"
